

Shipgen Platform AI Automation Playbook

FleetOps + Yard (YMS) + Parking (PMS)

Real User Workflow Perspective

Version: 1.0 | **Date:** July 09, 2026

Prepared for: Shipgen Product & Operations Teams

Purpose: Identify high-impact manual workflows to automate with AI

This playbook outlines where AI can reduce repetitive manual work across all three core engines, improve decision speed, and create measurable operational impact.

1. Why This Matters (As a Real User)

Operational users do not experience 'modules'; they experience interruptions, rework, and delay. AI should reduce repetitive effort and improve decision quality at the point of work.

- I re-enter the same data in multiple places.
- I spend too much time following up status manually.
- I detect exceptions late and escalate reactively.
- Shift handover reports consume high-value supervision time.
- Under pressure, avoidable mistakes happen in assignment and verification.

AI should act as an operations co-pilot:

- Prefill and validate before submission.
- Recommend next-best actions with rationale.
- Automate routine communication updates.
- Detect SLA and compliance risk early.
- Generate shift summaries and action lists automatically.

2. Cross-Engine Automation Opportunities

Workflow Family	Current Manual Pain	AI Automation Outcome
Data entry and form completion	Repeated typing, missing fields, inconsistent data	Context-aware prefill + OCR extraction + policy validation
Assignment and scheduling	Manual judgment each time under time pressure	Ranked recommendations (driver, dock, queue, slot) with confidence
Exception handling	Issues discovered late and handled via calls/chats	Early anomaly alerts + guided recovery playbooks
Status communication	Manual updates to customers/vendors/internal teams	Auto-generated ETAs, delay updates, and completion notifications
Shift reporting	Manual summaries from multiple screens/spreadsheets	Auto shift brief with KPI movement and unresolved backlog
Audit and compliance	Supervisors manually verify policy adherence	Continuous rule checks with explainable exception flags

3. FleetOps — Priority Automation Areas

3.1 Order intake and dispatch planning

Manual today: Dispatcher checks prior jobs, rates, constraints, and driver availability manually.

Automate: Auto-draft orders from messages/docs, suggest service/rate patterns, rank driver recommendations.

Impact: Faster order-to-dispatch cycle and fewer assignment errors.

3.2 Live monitoring and exception response

Manual today: Teams watch maps and timelines continuously to catch delays.

Automate: Detect route deviation, prolonged stops, and SLA risk; trigger role-specific action cards.

Impact: Earlier intervention and improved customer communication consistency.

3.3 POD quality and completion confidence

Manual today: POD validation and dispute readiness are mostly post-facto.

Automate: Check signature/photo quality, metadata consistency, and suspicious completion patterns.

Impact: Lower completion disputes and faster billing readiness.

4. Yard (YMS) — Priority Automation Areas

4.1 Appointment risk and gate decisioning

Manual today: Gate teams verify appointment/docs and handle mismatches manually.

Automate: Pre-arrival risk scoring + OCR-assisted validation + allow/hold/escalate recommendations.

Impact: Higher gate throughput with fewer policy violations.

4.2 Queue and dock optimization

Manual today: Coordinators reprioritize queue and docks reactively.

Automate: Dynamic priority and dock suggestions using SLA, readiness, labor, and cargo constraints.

Impact: Reduced detention and improved dock utilization.

4.3 Control tower incident intelligence

Manual today: Root cause correlation is fragmented across dashboards.

Automate: Correlate gate, queue, dock, and labor signals into one actionable incident narrative.

Impact: Faster recovery and better shift-level predictability.

5. Parking (PMS) — Priority Automation Areas

5.1 Entry and occupancy guidance

Manual today: Slot guidance and floor balancing rely on operator judgment during peaks.

Automate: Occupancy forecasting by floor/vehicle type and best-slot recommendations.

Impact: Faster entry movement and improved capacity utilization.

5.2 Payment and exit assurance

Manual today: Exit fee verification and dispute handling consume lane time.

Automate: Explainable payable calculation + anomaly checks for discounts/overrides.

Impact: Lower leakage and quicker exit processing.

5.3 Supervisor and revenue intelligence

Manual today: Shift summaries and revenue variance checks are manual.

Automate: Auto-generated shift summary, variance analysis, and next-shift action list.

Impact: Better managerial control with less report preparation effort.

6. Cross-Engine Differentiators (How Shipgen Stands Out)

Differentiator	What It Means Practically
Unified operational co-pilot	One assistant across FleetOps + YMS + PMS that understands dependencies and downstream impact.
Role-aware intelligence	Same event surfaces different action cards for dispatcher, gate operator, and supervisor.
End-to-end SLA chain	Track and explain SLA risk across engines instead of isolated module-level alerts.
Explainable AI audit trail	Every recommendation records signals, rationale, user action, and final outcome.

7. Practical Rollout Roadmap

Phase	Timeline	Primary Deliverables
Phase 1	0-6 weeks	Smart prefill, shift summaries, intelligent alert prioritization
Phase 2	6-12 weeks	Assignment recommendations, delay prediction, auto-communication workflows
Phase 3	12+ weeks	Cross-engine autonomous orchestration with human approval gates

8. Suggested Success Metrics

- 30-50% reduction in manual data-entry time.
- 20-35% reduction in decision cycle time (assignment/escalation).
- 15-25% reduction in SLA breaches and avoidable delays.
- 25-40% reduction in shift report preparation effort.

9. Safeguards for Responsible Automation

- Keep human approval for critical decisions (dispatch lock, gate deny, payment exception override).
- Show confidence score + rationale + alternative recommendation options.
- Use role-based alert routing to avoid operational alert fatigue.
- Run monthly outcome reviews to tune models/rules and prevent drift.
